Dear Valued Customer

Thank you for your recent inquiry about the level of crystalline silica present in the kaolin products produced by KaMin and CADAM. Our products are produced using a water washed process that allows us to efficiently remove any sand before we process our products. To ensure that our products are compliant with global regulatory limits on silica we measure the level of crystalline silica in our dry products on random basis on a yearly basis. Our measurements show that the respirable level of crystalline silica in all of our products is below the detection limit and regulatory limit of 0.1%.

Please let us know if you have any additional questions.

With Best Regards,

A handwritten signature in blue ink that reads 'Doug Carter'.
